

What “Intelligent AI” is Really About

by Miles Mathis

First published July 2, 2023

Today an article about the Godfather of AI Geoffrey Hinton hit the presses, and he is again warning about the dangers of AI taking over and suppressing or eliminating humans. It is the whole science fiction bugaboo we have been fed for decades through Hollywood, but now it is allegedly going from fiction to reality.

All for the birds, of course. Just look at the guy who is telling you this. Do you think it is just another mad coincidence that he has a giant hook nose? I know it is impolite to notice these things, but I can't help using my eyes and my brain. I'm just weird that way, I guess. These people are bad news, and that isn't a prejudice. It is based on centuries of experience, which is called learning. If I were a computer, it would be called learning, not prejudice. It would be called seeing what is there.

He is Geoffrey Everest Hinton CC FRS FRSC, so let's unpack that to start with. He is British Canadian, which means he was born in England and lives in Canada. His Wiki bio skips over his parents and early life, birthing him at Cambridge. So they are hiding his ancestry. CC means he is Order of Canada, a sort of Canadian knight tapped by the Queen. FRS means he is a fellow of the Royal Society, and FRSC means he is the same in Canada. The Royal Society is strictly for Phoenician spooks like Hinton. We find him in the peerage, but he is scrubbed even there. They really don't want us to know where this guy came from. But he is probably the son or nephew of the Baron Christopher Hinton, the director of the Atomic Energy Authority in the 1950s. These Hintons all come out of Cambridge. Since the whole Atomic Energy story is fiction, we see the lay of the land here already. Geoffrey followed in his father's footsteps.

We get a big clue early, when we find his degree in 1970 was in **experimental psychology**. Eight years later he got a PhD in artificial intelligence as a protege of Christopher Longuet-Higgins, another huge

red flag. Higgins was one of the Gang of Four with Freeman Dyson. Remember what Freeman Dyson looks like?

Longuet-Higgins has also been scrubbed from the peerage, but his family is there, including Aretas Akers-Douglas, Viscount Chilston, Home Secretary and St. John of Jerusalem. This links him to the Douglasses of Baads, Midlothian. Through his mother Bazeley he is also a Cecil, linking him to the Earls of Exeter. Longuet-Higgins also did not come out of cybernetics, having a degree in chemistry. Somehow he was appointed right out of school as a professor of theoretical physics at Kings College, London. We aren't told how that worked. By age 30 he was back at Cambridge teaching chemistry, and was already a Fellow. At age 44 they suddenly moved him into AI, when he co-founded the Department of Machine Intelligence and Perception at University of Edinburgh. Very weird. His other co-founders were psychologist Richard Gregory and superspook Donald Michie, who came out of Bletchley Park ([see my recent paper on Turing](#) for more on that). They admit he was Intelligence. His specialty was tic-tac-toe. No, seriously. This is why it was used in the movie *WarGames*. Another Phoenician inside joke.

So catalog that: all this AI hooey came out of military intelligence and the psychology departments. It is part of psychological warfare.

Anyway, it is worth mentioning that Michie's father-in-law was Sir Henry McLaren, Baron Aberconway, also a Melville though his wife. The McLarens were billionaire industrialists in Edinburgh, who got much of their money from the Quaker Brights, who controlled cotton manufacturing in that area as well as Manchester. So we see the usual suspects funding this project as well.

Michie was himself peerage, coming out of National and Grindley's Bank money. His mother was a Pfeiffer, confirming he was Jewish. His brother married a Courtauld, of that wealthy family. Think the Courtauld Institute. The Courtaulds are closely related to the Fetherstonhaughs, the Stuarts, and the Cecils. So we hit that again.

But back to Hinton. Hinton has been working for Google Brain for a decade, and is now 75. So, a decade past retirement age. Halfway through that stint at Google he received the Turing Award, but we aren't really told what for. Something to do with machine learning: all very foggy, as usual. More likely he was doing nothing but collecting awards, to set him up for this big fake reveal, where—as Godfather—he could warn us of the dangers of this stuff he has been working on all along. We see a lot of that right now, so we know they are setting us up for something big.

What is it? Well, I would say it is pretty obvious. They appear to be planning to take over the world, to an even greater extent than they already had. We would know that from the events of the past three years, without any talk of computers. And they have admitted they aren't finished. This is just the beginning, with fake pandemics, fake vaccines, as well as all other fakery. It is on a steep incline and they apparently have no plans to stop, due to pushback. They are apparently going to take this to its bitter end, which I predict will be bitterest for the Phoenicians themselves. But the point is, the world is about to be taken over, and for decades they have been arguing among themselves what bugbear to hide behind: aliens or AI. Hollywood has set us up for either fake emergency, so they have their pick. When the Phoenicians take over the world, they can either claim it was aliens or they can claim it was AI.

“No, we didn't just take over the world like Sauron, AI did! The computers have gone mad. They are out of our control!”

So it looks like we have that to look forward to. I really don't think anyone is going to buy it, which will make it all the more interesting. It looks like we are going to have a front-row seat to watch the Phoenicians burn themselves up on a pyre of their own hubris and miscalculation. I for one am going to enjoy it immensely, even if I have to go down as well. I have a clean conscience and do not fear death. The same cannot be said for them.
